

General Ledger System :

Munshiji is a pure general ledger product with a simple data structure, allowing other applications to be written around it. Information from modules such as Sales, Fixed Assets, Receivables, Payables etc. flows into the Munshiji allowing real time update of your financial statements. The application itself is used to generate the remainder of cash and bank vouchers and journal entries, that are not catered to from the modules. Thus, it potentially allows a company to use Munshiji as the general ledger application along with modules from other software companies. All they have to do is to send data to Munshiji in its required format.

Munshiji is also upgradeable. At the top end it offers a multi-user, multi-company, multi-branch, multi-currency system, but entry level systems can be configured for five users, single company, single branch, and single currency. Upgrading is a simple procedure.

Product Features:

- **Quick entry options for cash and bank vouchers**
